

# JAVASCRIPT DEVELOPMENT

Sasha Vodnik, Instructor

# HELLO!

1. Pull changes from the `svodnik/JS-SF-9-resources` repo to your computer
2. Open the `12-advanced-apis > starter-code` folder in your code editor

# LEARNING OBJECTIVES

At the end of this class, you will be able to

- › Generate API specific events and request data from a web service.
- › Implement a geolocation API to request a location.
- › Process a third-party API response and share location data on your website.
- › Make a request and ask another program or script to do something.
- › Search documentation needed to make and customize third-party API requests.

# **AGENDA**

- Configure 500px account and tools
- Implement authorization
- Implement geolocation
- Create and send API call
- Handle API response

---

## ADVANCED APIS

---

# WEEKLY OVERVIEW

### WEEK 7

Asynchronous JavaScript & Callbacks / Advanced APIs

**HOLIDAY WEEK — NO CLASS!**

### WEEK 8

Project 2 Lab / Closures & the module pattern

### WEEK 9

CRUD & Firebase / Deploying your app

# EXIT TICKET QUESTIONS

1. Is data the response from the api call? So when we do `function(data)` and `console.log(data)` do we have to use the word data?
2. Instead of:  
`process(38, 18, add);`  
`process(38, 18, subtract);`  
Could you do this:  
`process((38, 18, add), (38,18, subtract));`
3. Does having more apis make your website slower?

---

**JAVASCRIPT DEVELOPMENT**

---

# **ADVANCED APIS**

# ACTIVITY

---

## EXERCISE

### TYPE OF EXERCISE

---

► Turn & Talk

### TIMING

---

*2 min*

1. Think about a time you've granted an app access to your information from a different web service.
2. Find a partner or two, share your answers, and discuss.

# OAuth Flow

# **BUILDING OUR APP**

1. Configure our systems for development and testing, and review 500px developer configuration
2. Create our initial view
3. Get user's location
4. Create request to 500px with user's location info
5. Parse API response and add returned images to view

# BUILDING OUR APP

Our app

2 & 3

- Configure initial app view
- Get user's location

4

- Create request containing user's location info

- Parse API response
- Add returned images to view

5

500px.com server

# ENDPOINTS

- Examples from [openweathermap.org](https://openweathermap.org)

### By geographic coordinates

API call:

```
api.openweathermap.org/data/2.5/weather?lat={lat}&lon={lon}
```

Parameters:

**lat, lon** coordinates of the location of your interest

### By city name

API call:

```
api.openweathermap.org/data/2.5/weather?q={city name}
```

```
api.openweathermap.org/data/2.5/weather?q={city name},{country code}
```

### By ZIP code

Description:

Please note if country is not specified then the search works for USA as a default.

API call:

```
api.openweathermap.org/data/2.5/weather?zip={zip code},{country code}
```

# EXERCISE

---

## EXERCISE

### OBJECTIVE

---

- ▶ Search documentation needed to make and customize third-party API requests.

### TIMING

---

*4 min*

1. Read the documentation for at least 2 endpoints from the list at <https://github.com/500px/api-documentation#endpoints>
2. Identify an endpoint that will let us find photos based on a user's location.

# Create Conditional Views

# EXERCISE

---

## EXERCISE

### OBJECTIVE

---

- ▶ Write code to change the view of your single page app after user login

### TIMING

---

*5 min*

1. Add code to your application within the section that runs after the user logs in.
2. This code should hide the login prompt and instead show the section of the page that will display the results of our API request.  
HINT: This involves DOM manipulation. Think about how you could use the jQuery `hide()` and `show()` methods.

# Get User's Location

**Call the 500px endpoint**

# **Handle the Response**

# EXERCISE

---

## EXERCISE

### OBJECTIVE

---

- Process a third-party API response and share location data on your website.

### TIMING

---

*15 min*

1. Create a `handleResponseSuccess` callback function to do the following:
  - Iterate through your response data, creating an `img` element each time with the given image URL from the API.
  - Add the class `image` to the `img` element
  - Append the new `img` element to the element with the class `images`, which already exists in the HTML.

# Customize Search Results

# EXERCISE

---

## OBJECTIVE

---

- Search documentation needed to make and customize third-party API requests.

## TIMING

---

*until 9:20*

1. Search the API documentation as necessary to modify your API request to do the following:
  - Sort photos results by highest rated first
  - Return 28 photos instead of the default 20
2. BONUS: Display the current user's information on the site after a successful login. You'll need to look into the Users API or JavaScript SDK documentation to accomplish this.  
If your bonus code isn't working, try 1) disabling extensions, or 2) allowing third-party cookies (In Chrome, Preferences (scroll to bottom) > Advanced > Privacy & Security > Content Settings > Cookies > turn off "Block third party cookies")

EXERCISE

# **Exit Tickets!**

**(Class #12)**

## **LEARNING OBJECTIVES – REVIEW**

- Generate API specific events and request data from a web service.
- Implement a geolocation API to request a location.
- Process a third-party API response and share location data on your website.
- Make a request and ask another program or script to do something.
- Search documentation needed to make and customize third-party API requests.

# **NEXT CLASS PREVIEW**

## **In-class lab: Feedr**

- › Familiarize yourself with the API documentation for news sources.
- › Fork and clone your starter code.
- › Strategize ways to hide the loader and replace the content of the `#main` container with that of the API.
- › Look up other news sources that might be useful for the project.
- › Build content programmatically using ES6 template literals

# Q&A
